

# How i can get text value from body node?

Asked today   Modified today   Viewed 3 times

I need get node if it contains text. So when i process

0

tag - i need to check previous if it has text in body or in any child tag in

With next XSL code

```
ancestor::topic[1]/preceding-sibling::topic[1]/body/child::node()  
[(self::text() and normalize-space()) or self::*][position() = last()]
```

But it's for some reasons not working... Why?

```
<topic>  
  <body>Topic 3 with only a paragraph, no topic title</body>  
</topic>
```

```
<topic>  
  <body>  
    <p> <!-- from here -->  
      <image href="" />  
    </p> <!-- and from here -->  
  </body>  
</topic>
```

```
<topic>  
  <body>Topic 5 with only a paragraph, no topic title</body>  
</topic>
```

xslt
